As recognized, adventure as skillfully as experience approximately lesson, amusement, as skillfully as pact can be gotten by just checking out a ebook **The Archaeology Of Human Bones** also it is not directly done, you could believe even more on the subject of this life, nearly the world.

We give you this proper as skillfully as easy pretentiousness to acquire those all. We allow The Archaeology Of Human Bones and numerous book collections from fictions to scientific research in any way. in the middle of them is this The Archaeology Of Human Bones that can be your partner.

Right here, we have countless book **The Archaeology Of Human Bones** and collections to check out. We additionally provide variant types and furthermore type of the books to browse. The all right book, fiction, history, novel, scientific research, as competently as various further sorts of books are readily within reach here.

As this The Archaeology Of Human Bones, it ends happening being one of the favored ebook The Archaeology Of Human Bones collections that we have. This is why you remain in the best website to look the unbelievable book to have.

Thank you categorically much for downloading **The Archaeology Of Human Bones**. Most likely you have knowledge that, people have look numerous period for their favorite books past this The Archaeology Of Human Bones, but stop happening in harmful downloads.

Rather than enjoying a good book once a mug of coffee in the afternoon, instead they juggled once some harmful virus inside their computer. **The Archaeology Of Human Bones** is friendly in our digital library an online entry to it is set as public

appropriately you can download it instantly. Our digital library saves in multiple countries, allowing you to acquire the most less latency epoch to download any of our books when this one. Merely said, the *The Archaeology Of Human Bones* is universally compatible subsequently any devices to read.

When somebody should go to the book stores, search start by shop, shelf by shelf, it is really problematic. This is why we give the book compilations in this website. It will unquestionably ease you to see guide **The Archaeology Of Human Bones** as you such as.

By searching the title, publisher, or authors of guide you in fact want, you can discover them rapidly. In the house, workplace, or perhaps in your method can be every best place within net connections. If you strive for to download and install the *The Archaeology Of Human Bones*, it is enormously easy then, previously currently we extend the join to purchase and make bargains to download and install *The Archaeology Of Human Bones* for that reason simple!

How and when did we become the only human species to settle the whole earth? How did our brains become so large? In this book, Clive Gamble sets out to answer these fundamental questions, digging deep into the archives of archaeology, fossil ancestors and human genetics. The wealth of detail in these sources allows him to write a completely new account of our earliest beginnings: a deep history in which we devised solutions not only to the technical challenges of global settlement but also cracked the problem, long before writing and smartphones, of how to live apart yet stay in touch. *Archaeology: The Science of the Human Past* provides students with a thorough understanding of what archaeology is and how it operates and familiarizes them with fundamental archaeological concepts and methods. This

volume introduces the basic components of archaeology, including sites, artifacts, ecofacts, remote sensing, and excavation. It discusses how archaeologists obtain and classify information and how they analyze this information to formulate and test models of what happened in the past. Cultural resource management and the laws and regulations that deal with archaeology around the world are described. Archaeology is placed in the context of contemporary issues, from environmental problems to issues affecting Indigenous populations. The sixth edition has been updated and simplified to create a more streamlined volume to meet the needs of the students and teachers for whom it is designed, reflecting the latest developments in archaeological techniques and approaches. Allowing students to understand the theoretical and scientific aspects of archaeology and how various archaeological perspectives and techniques help us understand how and what we know about the past, *Archaeology: The Science of the Human Past* is an ideal introduction to archaeology. The impacts of climate change on human societies, and the roles those societies themselves play in altering their environments, appear in headlines more and more as concern over modern global climate change intensifies. Increasingly, archaeologists and paleoenvironmental scientists are looking to evidence from the human past to shed light on the processes which link environmental and cultural change. Establishing clear contemporaneity and correlation, and then moving beyond correlation to causation, remains as much a theoretical task as a methodological one. This book addresses this challenge by exploring new approaches to human-environment dynamics and confronting the key task of constructing arguments that can link the two in concrete and detailed ways. The contributors include researchers working in a wide variety of regions and time periods, including Mesoamerica, Mongolia, East Africa, the Amazon Basin, and the Island Pacific, among others. Using

methodological vignettes from their own research, the contributors explore diverse approaches to human-environment dynamics, illustrating the manifold nature of the subject and suggesting a wide variety of strategies for approaching it. This book will be of interest to researchers and scholars in Archaeology, Paleoenvironmental Science, Ecology, and Geology.

Christopher Tolan-Smith set out on a programme of fieldwork on caves and rockshelters in Mid Argyll to answer the question of why settlement on the west coast of Scotland appeared to happen later than in the islands. Our capacity to care about the wellbeing of others, whether they are close family or strangers, can appear to be unimportant in today's competitive societies. However, in this volume Penny Spikins argues that compassion lies at the heart of what makes us human. She takes us on a journey from the earliest stone age societies two million years ago to the lives of Neanderthals in Ice Age Europe, using archaeological evidence to illustrate the central role that emotional connections had in human evolution. Simple acts of kindness left to us from millions of years ago provide evidence for how social emotions and morality evolved, and how our capacity to reach out beyond ourselves into the lives of others allowed us to work together for a common good, and form the basis for human success. A powerful and innovative argument that explores the complexity of the human relationship with material things, demonstrating how humans and societies are entrapped into the maintenance and sustaining of material worlds Argues that the interrelationship of humans and things is a defining characteristic of human history and culture Offers a nuanced argument that values the physical processes of things without succumbing to materialism Discusses historical and modern examples, using evolutionary theory to show how long-standing entanglements are irreversible and increase in scale and complexity over time Integrates aspects of a diverse array of contemporary theories in archaeology and related natural and biological sciences Provides a critical review

of many of the key contemporary perspectives from materiality, material culture studies and phenomenology to evolutionary theory, behavioral archaeology, cognitive archaeology, human behavioral ecology, Actor Network Theory and complexity theory. The author presents a guide to interpreting human remains. The text covers why to study human remains from archaeological sites, ethical concerns and human remains, and the disposal and preservation of the dead. Then it delves into actual practice, describing excavation, processing, conservation, and curation. The core chapters focus on recording and analyzing data, considering in turn basic information, palaeopathology, and calling out the hard sciences. A final chapter ponders the future of the dead. A history of the first two attempts to reach the North Pole by airship investigates the stories behind the quests and explains how the expeditions were reported by journalists. Methodologies and legislative frameworks regarding the archaeological excavation, retrieval, analysis, curation and potential reburial of human skeletal remains differ throughout the world. As work forces have become increasingly mobile and international research collaborations are steadily increasing, the need for a more comprehensive understanding of different national research traditions, methodologies and legislative structures within the academic and commercial sector of physical anthropology has arisen. The Routledge Handbook of Archaeological Human Remains and Legislation provides comprehensive information on the excavation of archaeological human remains and the law through 62 individual country contributions from Europe, Asia, Africa, North America, South America and Australasia. More specifically, the volume discusses the following: What is the current situation (including a brief history) of physical anthropology in the country? What happens on discovering human remains (who is notified, etc.)? What is the current legislation regarding the excavation of archaeological human skeletal remains? Is a license needed to excavate human

remains? Is there any specific legislation regarding excavation in churchyards? Any specific legislation regarding war graves? Are physical anthropologists involved in the excavation process? Where is the cut-off point between forensic and archaeological human remains (e.g. 100 years, 50 years, 25 years...)? Can human remains be transported abroad for research purposes? What methods of anthropological analysis are mostly used in the country? Are there any methods created in that country which are population-specific? Are there particular ethical issues that need to be considered when excavating human remains, such as religious groups or tribal groups? In addition, an overview of landmark anthropological studies and important collections are provided where appropriate. The entries are contained by an introductory chapter by the editors which establish the objectives and structure of the book, setting it within a wider archaeological framework, and a conclusion which explores the current European and world-wide trends and perspectives in the study of archaeological human remains. The Routledge Handbook of Archaeological Human Remains and Legislation makes a timely, much-needed contribution to the field of physical anthropology and is unique as it combines information on the excavation of human remains and the legislation that guides it, alongside information on the current state of physical anthropology across several continents. It is an indispensable tool for archaeologists involved in the excavation of human remains around the world. "The Power of Nature address the force and impact of nature relative to human knowledge, action, and volition. Complex case studies address the ways in which nature retains the upper hand in human agentive environmental discourse, providing a new discussion of the role of human effects on the environment"-- This book uses evidence from empirical studies to understand conditions that led to the development of cognitive processes during evolution. UNDERSTANDING HUMANS: INTRODUCTION TO PHYSICAL ANTHROPOLOGY AND ARCHAEOLOGY shows

students how anthropologists and archaeologists go about their work as they study human evolution, living nonhuman primates, human adaptation and variation, the origin and dispersal of modern humans, food production, the first civilizations of the Old and New Worlds, and so much more. Using a biocultural approach, the text balances the presentation of physical anthropology with archaeology and concludes with a new chapter that ties together the material on human biological and cultural adaptation by focusing on lessons learned from our species evolution such as the impact of humans on the environment. Students will also benefit from the new chapter opening learning objectives, At a Glance sections that summarize key concepts, and end-of-chapter Critical Thinking Questions that help students better understand the material and study more effectively for exams. Important Notice: Media content referenced within the product description or the product text may not be available in the ebook version. Forensic archaeology has become a paramount tool with regard to the investigation of human rights abuses in recent times, by utilizing field techniques that provide a scientific means of searching, locating and recovering the victims of human rights abuses. By applying such techniques, human remains may be positively identified, thereby assisting survivors who are then able to lay their dead to rest and begin a process of closure after such tragic events have occurred. Additionally, the circumstances of the victim's demise will be accurately recorded, and in course this information will be duly presented in scientific terms to legal enforcing bodies, such as international criminal tribunals and domestic criminal courts. This book is unique in that it offers the reader a variety of topics and perspectives within one volume from contributors from across the globe, coming from a variety of diverse disciplines and experiences covering a broad spectrum that encompasses human rights investigations. It will also serve as a reference source for governmental agencies that are involved in conducting human rights investigations at various levels,

including the provision of effective military assistance to those working in the field. Non-governmental organizations involved in human rights investigations will also find it to be an excellent reference that may be utilized in order for them to more effectively provide assistance in the areas of psychological, social, health, and humanitarian assistance in zones where civilians have been killed on a large scale. The book will be of interest to professionals in the fields of forensic pathology, international law, sociology, cultural anthropology, political science and biological sciences. This advanced textbook provides the reader with an up-to-date account of recent developments and future potential in the study of human skeletons from both an archaeological and forensic context. It is well-illustrated, comprehensive in its coverage and is divided into six sections for ease of reference, encompassing such areas as palaeodemography, juvenile health and growth, disease and trauma, normal skeletal variation, biochemical and microscopic analyses and facial reconstruction. Each chapter is written by a recognised specialist in the field, and includes in-depth discussion of the reliability of methods, with appropriate references, and current and future research directions. It is essential reading for all students undertaking osteology as part of their studies and will also prove a valuable reference for forensic scientists, both in the field and the laboratory. This volume is the first text to focus specifically on the archaeology of domestic architecture. Covering major theoretical and methodological developments over recent decades in areas like social institutions, settlement types, gender, status, and power, this book addresses the developing understanding of where and how people in the past created and used domestic space. It will be a useful synthesis for scholars and an ideal text for advanced undergraduate and graduate courses in archaeology and architecture. The book-covers the relationship of architectural decisions of ancient peoples with our understanding of social and cultural institutions;-includes cases from every

continent and all time periods-- from the Paleolithic of Europe to present-day African villages;-is ideal for the growing number of courses on household archaeology, social archaeology, and historical and vernacular architecture. What makes us happy? What makes us sad? How do we come to feel a sense of enthusiasm? What fills us with lust, anger, fear, or tenderness? Traditional behavioral and cognitive neuroscience have yet to provide satisfactory answers. The Archaeology of Mind presents an affective neuroscience approach—which takes into consideration basic mental processes, brain functions, and emotional behaviors that all mammals share—to locate the neural mechanisms of emotional expression. It reveals—for the first time—the deep neural sources of our values and basic emotional feelings. This book elaborates on the seven emotional systems that explain how we live and behave. These systems originate in deep areas of the brain that are remarkably similar across all mammalian species. When they are disrupted, we find the origins of emotional disorders: - SEEKING: how the brain generates a euphoric and expectant response - FEAR: how the brain responds to the threat of physical danger and death - RAGE: sources of irritation and fury in the brain - LUST: how sexual desire and attachments are elaborated in the brain - CARE: sources of maternal nurturance - GRIEF: sources of non-sexual attachments - PLAY: how the brain generates joyous, rough-and-tumble interactions - SELF: a hypothesis explaining how affects might be elaborated in the brain The book offers an evidence-based evolutionary taxonomy of emotions and affects and, as such, a brand-new clinical paradigm for treating psychiatric disorders in clinical practice. This volume addresses the creation, documentation, preservation, and study of the archaeology of lunar, planetary, and interstellar exploration. It defines the attributes of common human technological expressions within national and, increasingly, private exploration efforts, and explore the archaeology of both fixed and mobile artifacts in the solar

system and the wider galaxy. This book presents the research of the foremost scholars in the field of space archaeology and heritage, a recent discipline of the field of Space Archaeology and Heritage. It provides the emerging archaeological perspective on the history of the human exploration of space. Since humans have been creating a vast archaeological preserve in space and on other celestial bodies. This assemblage of heritage objects and sites attest to the human presence off the Earth and the study of these material remains are best investigated by archaeologists and historic preservationists. As space exploration has reached the half century mark, it is the appropriate time to reflect on the major events and technological development of this particular unique 20th century arena of human history. The authors encapsulate various ways of looking at the archaeology of both fixed and mobile human artifacts in the solar system. As missions continue into space, and as private ventures gear up for public and tourist visits to space and to the Moon and even Mars, it is the appropriate time to address questions about the meaning and significance of this material culture. International archaeologists examine early Stone Age tools and bones to present the most holistic view to date of the archaeology of human origins. Over the centuries, researchers have found bones and artifacts proving that humans like us have existed for millions of years; the author argues, however, that mainstream science has suppressed these facts and that prejudices based on current scientific theory act as a "knowledge filter," giving us a picture of prehistory that is largely incorrect. Comprehensive reference to use of human bones and teeth in interpreting past lives. The aim of this book is to provide an introduction to what can be learnt from the scientific study of human skeletal remains from archaeological sites. Possibly one of the most significant, yet most overlooked, works of the twentieth century, it was *The Order of Things* that established Foucault's reputation as an intellectual giant. Definitive analyses of these unique Pacific coast islands and their

inhabitants A powerful and innovative argument that explores the complexity of the human relationship with material things, demonstrating how humans and societies are entrapped into the maintenance and sustaining of material worlds Argues that the interrelationship of humans and things is a defining characteristic of human history and culture Offers a nuanced argument that values the physical processes of things without succumbing to materialism Discusses historical and modern examples, using evolutionary theory to show how long-standing entanglements are irreversible and increase in scale and complexity over time Integrates aspects of a diverse array of contemporary theories in archaeology and related natural and biological sciences Provides a critical review of many of the key contemporary perspectives from materiality, material culture studies and phenomenology to evolutionary theory, behavioral archaeology, cognitive archaeology, human behavioral ecology, Actor Network Theory and complexity theory Relational Identities and Other-than-Human Agency in Archaeology explores the benefits and consequences of archaeological theorizing on and interpretation of the social agency of nonhumans as relational beings capable of producing change in the world. The volume cross-examines traditional understanding of agency and personhood, presenting a globally diverse set of case studies that cover a range of cultural, geographical, and historical contexts. Agency (the ability to act) and personhood (the reciprocal qualities of relational beings) have traditionally been strictly assigned to humans. In case studies from Ghana to Australia to the British Isles and Mesoamerica, contributors to this volume demonstrate that objects, animals, locations, and other nonhuman actors also potentially share this ontological status and are capable of instigating events and enacting change. This kind of other-than-human agency is not a one-way transaction of cause to effect but requires an appropriate form of reciprocal engagement indicative of relational personhood, which in these cases, left material

traces detectable in the archaeological record. Modern dualist ontologies separating objects from subjects and the animate from the inanimate obscure our understanding of the roles that other-than-human agents played in past societies. *Relational Identities and Other-than-Human Agency in Archaeology* challenges this essentialist binary perspective. Contributors in this volume show that intersubjective (inherently social) ways of being are a fundamental and indispensable condition of all personhood and move the debate in posthumanist scholarship beyond the polarizing dichotomies of relational versus bounded types of persons. In this way, the book makes a significant contribution to theory and interpretation of personhood and other-than-human agency in archaeology. Contributors: Susan M. Alt, Joanna Brück, Kaitlyn Chandler, Erica Hill, Meghan C. L. Howey, Andrew Meirion Jones, Matthew Looper, Ian J. McNiven, Wendi Field Murray, Timothy R. Pauketat, Ann B. Stahl, Maria Nieves Zedeño

Where did we come from? To answer this question, anthropologists reconstruct the human past and study the human present from both biological and cultural perspectives. *Human Antiquity* offers an absorbing, straightforward explanation of human origins and evolution by thoroughly integrating physical anthropology and archaeology. Co-authors Kenneth Feder and Michael Park combine the ideas, methods, and knowledge from both biological anthropology and archaeology into a unified effort: Feder is an archeologist who conducts surveys, excavations, and analyses to understand the native inhabitants of New England; Park is a biological anthropologist interested in the application of evolutionary theory to the biological history of our species. *The Archaeology of Human Bones* provides an up to date account of the analysis of human skeletal remains from archaeological sites, introducing students to the anatomy of bones and teeth and the nature of the burial record. Drawing from studies around the world, this book illustrates how the scientific study of human remains can shed light upon important

archaeological and historical questions. This new edition reflects the latest developments in scientific techniques and their application to burial archaeology. Current scientific methods are explained, alongside a critical consideration of their strengths and weaknesses. The book has also been thoroughly revised to reflect changes in the ways in which scientific studies of human remains have influenced our understanding of the past, and has been updated to reflect developments in ethical debates that surround the treatment of human remains. There is now a separate chapter devoted to archaeological fieldwork on burial grounds, and the chapters on DNA and ethics have been completely rewritten. This edition of *The Archaeology of Human Bones* provides not only a more up to date but also a more comprehensive overview of this crucial area of archaeology. Written in a clear style with technical jargon kept to a minimum, it continues to be a key work for archaeology students.

Archaeology as Human Ecology is a new introduction to concepts and methods in archaeology. It deals not with artifacts, but with sites, settlements, and subsistence. It is essential reading for students, research workers, and all concerned with archaeological method and theory. Human social life is constrained and defined by our cognitive and emotional dispositions, which are the legacy of our foraging ancestors. But how difficult is it to reconstruct the social systems and cultural traditions of those ancestors? *The Archaeology of Human Ancestry* provides a stimulating and provocative answer, in which archaeologists and biological anthropologists set out and demonstrate their reconstructive methods. Contributors use observations of primates and modern hunter-gatherers to illuminate the fossil and artefactual records. Thematic treatment covers the evolution of group size; group composition and the emotional structure of social bonds; sexual dimorphism and the sexual division of labour; and the origins of human cultural traditions. *The Archaeology of Human Ancestry* is an essential

introduction to the subject for advanced undergraduates and researchers in archaeology and biological anthropology. It will also be used by workers in psychology, sociology and feminist studies as a resource for understanding human social origins. This volume details how new theories and methods have recently advanced the archaeological study of initial human colonization of islands around the world, including in the southwest Pacific, the Mediterranean, the Caribbean, and Southeast Asia. This global perspective brings into comparison the wide variety of approaches used to study these early migrations and illuminates current debates in island archaeology. Evidence of island colonization is often difficult to find, especially in areas impacted by sea level rise, and these essays demonstrate how researchers have tackled this and other issues. Contributors show the potential of computer simulations of voyaging in determining the range of timing and origin points that were possible in the past. They discuss how Bayesian modeling helps address uncertainties and controversies surrounding radiocarbon dating. Additionally, advances in biomolecular techniques such as ancient DNA (aDNA), paleoproteomics, analysis of human microbiota, and improved resolution in isotopic analyses are providing more refined information on the homelands of initial settlers, on individual life courses, and on population-level migrations. Islands offer rich opportunities to examine the exploratory nature of the human species, providing insights into the evolution of watercraft technologies and wayfinding, the impact of humans on their new environments, and the motivations for their journeys. The *Archaeology of Island Colonization* represents the innovative ways today's archaeologists are reconstructing these unique paleolandscapes. A volume in the series *Society and Ecology in Island and Coastal Archaeology*, edited by Victor D. Thompson. Epic in scope, yet filled with detail, this illustrated guide takes readers through the whole of our human past. Spanning the dawn of human civilization through the present, it provides a tour of

every site of key archaeological importance. From the prehistoric cave paintings of Lascaux to Tutankhamun's tomb, from the buried city of Pompeii to China's Terracotta Army, all of the world's most iconic sites and discoveries are here. So too are the lesser-known yet equally important finds, such as the recent discoveries of our oldest known human ancestors and of the world's oldest-known temple, Göbekli Tepe in Turkey. A masterful combination of succinct analysis and driving narrative, this book also addresses the questions that inevitably arise as we gradually learn more about the history of our species. Written by an international team of archaeological experts and richly illustrated throughout, *Archaeology: The Essential Guide to Our Human Past* offers an unparalleled insight into the origins of humankind.

Archaeology as Human Ecology is a new introduction to concepts and methods in archaeology. It deals not with artifacts, but with sites, settlements, and subsistence. Karl W. Butzer's goal is to interpret the ecosystem of which an archaeological site or site network was part. Components of this study include geo-archaeology, archaeobotany, zoo-archaeology, and archaeometry. These methods are then used in examining interactions between human communities and their biophysical environment: the impact of settlement on site formation and the effects of subsistence activities on plants, animals, soils, and overall landscape modification. Finally, the methods and theoretical approach, are applied to examine the processes of cultural change and continuity. The approach of *Archaeology as Human Ecology* goes far beyond traditional environmental archaeology, which is concerned with simple reconstruction. It provides a clear, systemic approach that immediately allows an assessment of interactions. For the first time, it attempts to develop a comprehensive spatial archaeology - one that is far more than derivative spatial analysis. *The Bioarchaeology of Metabolic Bone Disease* provides a comprehensive and invaluable source of information on this important group of diseases. It is an essential

guide for those engaged in either basic recording or in-depth research on human remains from archaeological sites. The range of potential tools for investigating metabolic diseases of bone are far greater than for many other conditions, and building on clinical investigations, this book will consider gross, surface features visible using microscopic examination, histological and radiological features of bone, that can be used to help investigate metabolic bone diseases. Clear photographs and line drawings illustrate gross, histological and radiological features associated with each of the conditions. Covers a range of issues pertinent to the study of metabolic bone disease in archaeological skeletal material, including the problems that frequent co-existence of these conditions in individuals living in the past raises, the preservation of human bone and the impact this has on the ability to suggest a diagnosis of a condition. Includes a range of conditions that can lead to osteopenia and osteoporosis, including previous investigations of these conditions in archaeological bone. This book expands on *Archaeological Human Remains: Global Perspectives* that was published in the Springer Briefs series in 2014 and which had a strong focus on post-colonial countries. In the current volume, the editors include papers that deal with non-Anglophone European traditions such as Portugal, Germany and France. In addition, authors continue the exploration of osteological trajectories that are not well-documented in the West, such as Senegal, China and Russia. The lasting legacies of imperialism, communism and colonialism are apparent as the authors of the individual country profiles examine the historical roots of the study of archaeological human remains and the challenges encountered while also considering the likely future directions likely of this multi-faceted discipline in different world areas. Illuminating the world of archaeology. Archaeology conveys the excitement of archaeological discovery and explains how archaeologists think as they scientifically find, analyze, and interpret evidence. The main objective of this text is to provide an

introduction to the broad and fascinating world of archaeology from the scientific perspective. Discussions on the theoretical aspects of archaeology, as well as the practical applications of what is learned about the past, have been updated and expanded upon in this fourth edition. Learning Goals Upon completing this book, readers will be able to: Discuss the theoretical aspects of archaeology. Apply what has been learned about the past. Identify the various perspectives archaeologists have. A collection of the most influential papers of the late Glynn Isaac. With vast erudition, Foucault cuts across disciplines and reaches back into seventeenth century to show how classical systems of knowledge, which linked all of nature within a great chain of being and analogies between the stars in the heavens and the features in a human face, gave way to the modern sciences of biology, philology, and political economy. The result is nothing less than an archaeology of the sciences that unearths old patterns of meaning and reveals the shocking arbitrariness of our received truths. In the work that established him as the most important French thinker since Sartre, Michel Foucault offers startling evidence that "man"—man as a subject of scientific knowledge—is at best a recent invention, the result of a fundamental mutation in our culture. This cross-cultural study uses a variety of geophysical and archaeological data from the Old and New Worlds to identify the key attributes of natural disasters and the ways in which human social systems respond to them. This volume addresses the directions that studies of archaeological human remains have taken in a number of different countries, where attitudes range from widespread support to prohibition. Overlooked in many previous publications, this diversity in attitudes is examined through a variety of lenses, including academic origins, national identities, supporting institutions, archaeological context and globalization. The volume situates this diversity of attitudes by examining past and current tendencies in studies of archaeologically-retrieved human remains across a range of

geopolitical settings. In a context where methodological approaches have been increasingly standardized in recent decades, the volume poses the question if this standardization has led to a convergence in approaches to archaeological human remains or if significant differences remain between practitioners in different countries. The volume also explores the future trajectories of the study of skeletal remains in the different jurisdictions under scrutiny.
