Readings in Applied Microeconomics Jun 07 2021 A central concern of economics is how society allocates its resources. Modern economies rely on two institutions to allocate: markets and governments. But how much of the allocating should be performed by markets and how much by governments? This collection of readings will help students appreciate the power of the market. It supplements theoretical explanations of how markets work with concrete examples, addresses questions about whether markets actually work well and offers evidence that supposed "market failures" are not as serious as claimed. Featuring readings from Hayek, William Baumol, Harold Demsetz, Daniel Fischel and Edward Lazear, Benjamin Klein and Keith B. Leffler, Stanley J. Liebowitz and Stephen E. Margolis, and John R. Lott, Jr., this book covers key topics such as: • Why markets are efficient allocators • How markets foster economic growth • Property rights • How markets choose standards • Asymmetric Information • Whether firms abuse their power • Non-excludable goods • Monopolies The selections should be comprehended by undergraduate students who have had an introductory course in economics. This reader can also be used as a supplement for courses in intermediate microeconomics, industrial organization, business and government, law and economics, and public policy.

Spectral Methods for the Estimation of the Effective Elastic Thickness of the Lithosphere Mar 04 2021 Although several excellent works exist that describe the effective elastic thickness (T_e) of the lithosphere—its theory, significance and relevance to Earth sciences in general—none cover the details of the methods for its estimation. This book brings together the disparate knowledge required to estimate T_e in one handy volume: signal processing, harmonic analysis, civil engineering, and foundational mathematics and physics, in addition to the relevant geophysics and, to a lesser extent, geology. Its two principal focus areas are spectral estimation, covering various approaches to estimating the admittance and coherence between gravity and topography using Slepian multitapers and fan wavelets; and algebraic and finite difference solutions of the plate bending partial differential equation in a variety of geological settings. This book would be suitable for postgraduate students beginning their research, up to faculty professors interested in diversifying their skills.

Optimization Methods in Finance Dec 01 2020 Optimization models play an increasingly important role in financial decisions. This is the first textbook devoted to explaining how recent advances in optimization models, methods and software can be applied to solve problems in computational finance more efficiently and accurately. Chapters discussing the theory and efficient solution methods for all major classes of optimization problems alternate with chapters illustrating their use in modeling problems of mathematical finance. The reader is guided through topics such as volatility estimation, portfolio optimization problems and constructing an index fund, using techniques such as nonlinear optimization models, quadratic programming formulations and integer programming models respectively. The book is based on Master's courses in financial engineering and comes with worked examples, exercises and case studies. It will be welcomed by applied mathematicians, operational researchers and others who work in mathematical and computational finance and who are seeking a text for self-learning or for use with courses.

Reconfigurable Computing: Architectures and Applications Feb 15 2022 1 The International Workshop on Reconfigurable Computing (ARC) started in 2005 in Algarve, Portugal. The major motivation was to create an event where on-going research efforts as well as more elaborated, interesting and high-quality work on applied reconfigurable computing could be presented and discussed. Over the last couple of years reconfigurable computing has become a well-known and established research area producing interesting as well as important results in both general and embedded computing systems. It is also getting more and more interest from industry which is attracted by the (design and development) flexibility as well as the performance improvements that can be expected from this technology. As reconfigurable computing has blurred the gap between software and hardware, some even speak of a radical new programming paradigm opening a new realm of unseen applications and opportunities. The logo of the ARC workshop is the Nonius, a measurement instrument used in the Portuguese period of discoveries that was invented by Pedro Nunes, a Portuguese mathematician. As the logo suggests, the main motto of ARC is to help to navigate the world of reconfigurable computing. Driven by this

motto, we hope ARC contributes to solid advances on recon?gurable computing.

Extraordinary Entrepreneurship Mar 24 2020 The 21st Century brings all new rules. Entrepreneurs are challenging conventional wisdom and thinking outside the box. One of the first challenges involves challenging the assumption that a business has to be big to be successful. While most of the 20th century heralded big businesses, it is clear that businesses no longer have to be big to do big business. Now it is possible for a handful of people to operate a global business from virtually any place on the planet. Today, the keyboard has overtaken the boardroom. Financial markets, alliances, and joint ventures have eliminated the need for entrepreneurs to put up substantial capital investments. Today's businesses are driven by ideas, innovation, and execution. This book will show entrepreneurs and business leaders will provide CEOs and entrepreneurs with the tools that they will need to become leaders in their market.
