It maintains a consistent level throughout so that graduate students can use it to gain a foothold into this dynamic research area. This book describes the essential aspects of enantioselective catalysis in a clear, logical fashion, with chapters organized by concept rather than by reaction type. Each concept in Fundamentals of Asymmetric Catalysis is supported by carefully selected examples of a wide range of catalysts, reactions and reaction mechanisms. The book is not a set of pat statistical procedures but rather an approach. In this broad introduction to topology, the author searches for topological invariants of spaces, together with techniques for their calculating. Students with knowledge of real analysis, elementary group theory, and linear algebra will quickly become familiar with a wide variety of techniques and applications involving point-set, geometric, and algebraic

topology. Over 139 illustrations and more than 350 problems of various difficulties help students gain a thorough understanding of the subject. Twenty articles focus on the most significant sources of nitrogen in the biosphere--macromolecules such as proteins, amino sugars, nucleic acids, and others. The articles review current research, questions pertaining to the stability of N-containing macromolecules, and the process that they undergo during diagenesis. Also discussed are the fates of proteins and amino acids in the natural environment, the distribution and biodegradation of chitin (an amino sugar), the amplification of DNA in ancient samples, and the fate of so-called "unidentified" organic nitrogen in soils and sedimentary rocks. Mounting and housing of works of art on paper have always had an important influence on both the survival and the appreciation of the work. Many dangers of a physical, biological and chemical nature await unprotected works of art on paper and specialist mounting provides the primary way of safeguarding them. Also, since the way in which works are presented to the public affects their perception of them, mounting of works of art can contribute significantly to the success or failure of an exhibition. A variety of problems, solutions, past practice and future developments in the mounting, storage and display of artworks on paper are considered in this volume of thirty-one articles presented at a conference at the British Museum*. These include the significance of mounting in the historical study of prints and drawings, the preventive care of paper artifacts, their aesthetic presentation and the management of paper collections. This volume (originally published in 2005) can be considered a companion volume to Conservation Mounting for Prints and Drawings: A Manual Based on Current Practice at the British Museum by Joanna M. Kosek (Archetype Publications 2004). Both volumes are essential tools for the owner, collector, curator, conservator and all professionals who deal with works of art on paper. *Conference entitled: Mounting and Housing Art on Paper for Storage and Display: History, Science and Present-Day Practice. Supramolecular chemistry is one of the most actively pursued fields of science. Its implications reach from molecular recognition in synthetic and natural complexes to exciting new applications in chemical technologies, materials, and biological and medical science. Principles and Methods in Supramolecular Chemistry gives a systematic and concise overview of this diverse subject. Particular emphasis is given to the physical principles and methods which are important in the design, characterization, and application of supramolecular systems. Features that make this monograph essential reading for graduates and researchers in this area include: * A comprehensive overview of non-covalent interactions in supramolecular complexes * A guide to characterizing such complexes by physical methods * Selected applications of synthetic supramolecular systems * Question and answer sections * Illustrations from the Author's webpage which compliment the book. The Junius Manuscript These notes are a record of a one semester course on Functional Analysis given by the author to second year Master of Statistics students at the Indian Statistical Institute, New Delhi. Students taking this course have a strong background in real analysis, linear algebra, measure theory and probability, and the course proceeds rapidly from the definition of a normed linear space to the spectral theorem for bounded selfadjoint operators in a Hilbert space. The book is organised as twenty six lectures, each corresponding to a ninety minute class session. This may be helpful to teachers planning a course on this topic. Well prepared students can read it on their own. In the third edition of this classic the chapter on quantum Marcov processes has been replaced by a chapter on numerical treatment of stochastic differential equations to make the book even more valuable for practitioners. Maisy's colourful lift-the-flap, pull-the-tab books encourage children to learn with the little mouse. In Maisy's Book of Colours children can see her with her red coat and her white bathrobe, driving her green train and sailing on the blue sea. Inflationary cosmology has been developed over the last twenty years to remedy serious shortcomings in the standard hot big bang model of the universe. This textbook, first published in 2005, explains the basis of modern cosmology and shows where the theoretical results come from. The book is divided into two parts; the first deals with the homogeneous and isotropic model of the Universe, the second part discusses how inhomogeneities can explain its structure. Established material such as the inflation and quantum cosmological perturbation are presented in great detail, however the reader is brought to the frontiers of current cosmological research by the discussion of more speculative ideas. An ideal textbook for both advanced students of physics and astrophysics, all of the necessary background material is included in every chapter and no prior knowledge of general relativity and quantum field theory is assumed. This second edition includes exercises at the end of each chapter, revised bibliographies, references and an index. Organic Synthesis: Strategy and Control is the long-awaited sequel to Stuart Warren’s bestseller Organic Synthesis: The Disconnection Approach, which looked at the planning behind the synthesis of compounds. This unique book now provides a comprehensive, practical account of the key concepts involved in synthesising compounds and focuses on putting the planning into practice. The two themes of the book are strategy and control: solving problems either by finding an alternative strategy or by controlling any established strategy to make it work. The book is divided into five sections that deal with selectivity, carbon-carbon single bonds, carbon-carbon double bonds, stereochemistry and functional group strategy. A comprehensive, practical account of the key concepts involved in synthesising compounds Takes a mechanistic approach, which explains reactions and gives guidelines on how reactions might behave in different situations Focuses on reactions that really work rather than those with limited application Contains extensive, up-to-date references in each chapter Students and professional chemists familiar with Organic Synthesis: The Disconnection Approach will enjoy the leap into a book designed for chemists at the coalface of organic synthesis. An Introduction to Organic Geochemistry explores the fate oforganic matter of all types, biogenic and man-made, in the EarthSystem. investigates the variety of pathways and biogeochemicaltransformations that carbon compounds can experience over a rangeof time scales and in different environments scope widened to provide a broad and up-to-date background -structured to accommodate readers with varied scientificbackgrounds essential terminology is defined fully and boxes are used toexplain concepts introduced from other disciplines further study aided by the incorporation of carefully selectedliterature references It investigates the variety of pathways and biogeochemicaltransformations that carbon compounds can experience over a rangeof time scales and in different environments. The matrix isolation (MI) method has now been used for nearly thirty years. During this period it has been actively developed and the range of problems tackled greatly extended. Originally it was used for studies of transient species involv ing vibrational, electronic and ESR spectroscopy. Nowadays the study of transient species forms a comparatively small part of HI work since it has been amply demonstrated that very fruitful information can be obtained of the structure and interactions of stable molecules and their aggregates. In addition to the s~ectroscopic methods mentioned above the MI technique is nowadays a standard method in research based on vibrational relaxation, luminescence, Mossbauer, magnetic circular dichroism, pulsed NMR and photoelectron spectroscopy. The matrix isolation technique affords considerable advantages over more conventional methods in most applications of spectroscopy. Areas where the technique has been widely applied, or shows great potential, include: metal atom chemistry, and its relation to surface chemistry, high temperature inorganic species, transition metal complexes, interstellar species, free radicals and unstable molecules, conformational studies, molecular com plexes, and intermolecular forces. Physics of Optoelectronics focuses on the properties of optical fields and their interaction with matter. Understanding that lasers, LEDs, and photodetectors clearly exemplify this interaction, the author begins with an introduction to lasers, LEDs, and the rate equations, then describes the emission and detection processes. The book summarizes and reviews the mathematical background of the quantum theory embodied in the Hilbert space. These concepts highlight the abstract form of the linear algebra for vectors and operators, supplying the "pictures" that make the subject more intuitive. A chapter on dynamics includes a brief review of the formalism for discrete sets of particles and continuous media. It also covers the quantum theory necessary for the study of optical fields, transitions, and semiconductor gain. This volume supplements the description of lasers and LEDs by examining the fundamental nature of the light that these devices produce. It includes an analysis of quantized electromagnetic fields and illustrates inherent quantum noise in terms of Poisson and sub-Poisson statistics. It explains matter-light interaction in terms of time-dependent perturbation theory and Fermi's golden rule, and concludes with a detailed discussion of semiconductor emitters and detectors.
