The input for this code is the same as in the usual shell-model codes, namely, the single-particle orbital properties and the antisymmetric two-

body matrix elements. To calculate the moments for fixed values of the angular momentum (J) a method described by Ginocchio is used. All of the "basic inputs" needed in the reduction formula were derived without any restrictions on the orbitals. The formulas used in DENSJT are described, and the basic inputs are listed in tables. A block flow chart showing the general structure and the specific function of each subroutine is included. All necessary information for the input and output of this code is described. A calculation

involving 3 orbitals in the s-d shell took 1 second on a CDC Cyber-70 computer. (RWR). (1995-2007) The  
XB-70 Valkyrie was  
an aircraft ahead of  
its time. Equipped  
with drooping  
wingtips, and  
designed with one  
of the highest lift-  
to-drag ratios in  
aviation history, the  
XB-70 challenged  
the known concepts

of the flight  
envelope and  
demanded  
extraordinary  
developments in  
engineering and  
construction. The  
test program  
produced promising  
results, including a  
Mach 3 flight in  
May of 1966. Yet  
after a disastrous  
collision later that  
year resulted in the  
loss of one of two  
prototypes, the  
Valkyrie program  
was curtailed. The  
remaining craft was  
retired in 1969.
