Reducing and managing humanity's demand for energy is a fundamental part of the effort to mitigate climate change. In this, the most comprehensive textbook ever written on the subject, L.D. Danny Harvey lays out the theory and practice of how things must change if we are to meet our energy needs sustainably. The book begins with a succinct summary of the scientific basis for concern over global warming, then outlines energy basics and current patterns and trends in energy use. This is followed by a discussion of current and advanced technologies for the generation of electricity from fossil fuels. The book then considers in detail how energy is used, and how this use can be dramatically reduced, in the following end-use sectors: - buildings - transportation - industry - food and agriculture - municipal services The findings from these sector-by-sector assessments are then applied to generate scenarios of how global energy demand could evolve over the coming decades with full implementation of the identified and economically-feasible energy-saving potential. The book ends with a brief discussion of policies that can be used to reduce energy demand, but also addresses the limits of technologically-based improvements in efficiency in moderating demand and of the need to re-think some of our underlying assumptions concern ends with a brief discussing what we really need. Along with its companion volume on C-free energy supply, and accompanied by extensive supplementary online material, this is an essential resource for students and practitioners in engineering, architecture, environment and energy related fields. Online material includes: Excel-based computational exercises, teaching slides for each chapter, links to free software tools. The essays from the pen of Daniel Weeks in A More Prosaic Light range from social and political commentary to literary criticism and reminiscences about the literary and cultural scene on the Jersey Shore. Weeks tackles topics as diverse as Hollywood movies, middle school jitters, Thanksgiving, the dying fishing industry in New Jersey, Edison's phonograph, heat waves, the great Englishtown Auction, Romantic poetry, and the elusive American Dream. Weeks's literary essays also range widely from the poets of the British canon-Coleridge, Keats, and Yeats-to American moderns and contemporaries-Amiri Baraka, Charles Olson, Robert Pinsky, and Louise Glück. The essays and reviews here are interspersed with Weeks's reminiscences of his encounters with various writers, which provide an entertaining inside view of the literary scene on the Jersey Shore during the late twentieth and early twenty-first centuries. This book is about prescriptive analytics. It provides business practitioners and students with a selected set of management science and optimization techniques and discusses the fundamental concepts, methods, and models needed to understand and implement these techniques in the era of Big Data. A large number of management science models exist in the body of literature today. These models include optimization techniques or heuristics, static or dynamic programming, and deterministic or stochastic modeling. The topics selected in this book, mathematical programming and simulation modeling, are believed to be among the most popular management science tools, as they can be used to solve a majority of business optimization problems. Over the years, these techniques have become the weapon of choice for decision makers and practitioners when dealing with complex business systems.
