**Investigating the Functional Independence of Mands and Tacts in Children with Intellectual Disabilities** Jun 20 2020 The functional

independence of verbal operants was investigated by training both mands and tacts of highly preferred items to children with intellectual disabilities. The schedules of reinforcement for mands were then altered to see how it affects tacts. The schedules of reinforcement for tacts were also altered to see how it affects mands. Given that there is functional independence, when increasing the schedule of reinforcement for one verbal operant, i.e., mand or tact, it should not affect the accuracy of responding of the other verbal operant within the same session. In contrast, if there is functional interdependence, then it should affect the accuracy of responding of the other verbal operant within the same session. For one participant, he demonstrated evidence for functional independence. For the second participant, he demonstrated evidence for both functional independence and functional interdependence. For the third participant, she demonstrated evidence for functional independence. Across all three participants, the results may be explained by satiation. Due to the mixed results of this study, the value of investigating the functional independence of mands and tacts is challenged.

**Functional Independence Skills Handbook** Dec 19 2022 "A primer on teaching people with developmental disabilities more functional independence. Includes an assessment and a full curriculum complete with lesson plans for each of the 421 items assessed. Domains of learning include adaptive behavior, affective skills, cognitive abilities, sensory motor functions, socialization, speech & language and vocational skills."

The Reliability and Validity of the Functional Independence Measure (FIM) - Evaluation on Chronically Disabled and Community Dwelling Advanced Elderly May 12 2022

**Functional Independence Measure (FIM)** Aug 15 2022 Uppsats, påbyggnadsutbildning i arbetsterapi. Syftet var att beskriva Functional Independence Measure (FIM) och ge exempel på hur detta används i Sverige idag. 94 patienter bedömdes vid in- och utskrivning av teamet på rehabiliteringsavdelningen på Sahlgrenska sjukhuset. Patienterna

delades in i 3 diagnosgrupper: slaganfall med högersidig resp vänstersidig hemiplegi samt övriga diagnoser. Dimensionsanalysen visar att fysiska och sociala/kognitiva data ska bearbetas separat. De fysiska variablerna har likartad svårighetsgrad för de olika diagnosgrupperna, medan det för de sociala/kognitiva variablerna finns betydande skillnader. Variationer i vårdtidslängd kan förklaras med hjälp av FIM upp till drygt 50 %.

**A Theoretical Perspective of Factors that Relate to the Functional Independence of Mature Adults** Sep 04 2021 Limitations of policy makers and health care providers understanding about living conditions in later adulthood continually constrains mature adults from doing more for themselves, and society. These circumstances move society to devalue mature adults. Less valued mature adults tend to become even more dependent, that is, increasingly less willing to care for themselves, and less able to contribute to the social good. As a result, a vicious cycle was created, and it caused mature adults to live lower quality lives, and become increasingly dependent on others. To empower mature adults in later life, this study does the preliminary work to develop an instrument to discover which quality of life indicators/factors best explain Functional Independence (FI). The six indicators investigated were the (1) Activities of Daily Living Status (ADLS) or competency in the performance of essential daily tasks, (2) Physical Status (PS) or the level of physical activity, (3) Cognitive Status (CS) or good mental health, (4) Social Status (SS) or supportive relationships, (5) Environmental Status (ES) or the freedom from undue stressful life events and everyday frustrations, and (6) Health Status (HS) or the mitigation/absence of chronic diseases. Empowering mature adults to do more for themselves, and society has the potential to engender more enlightened social attitudes about later adulthood. To learn more about these six quality of life indicators, data highlighting the most relevant research studies were accumulated, and a 32-question survey was created. Administrators then were contacted from five senior citizen centers to make arrangements to administer the

survey. After taking steps to protect all subjects, the survey questionnaire was piloted to a sample of 10-12 mature adults, and then completed by a total sample of 160 subjects who could be conveniently recruited at the five senior citizen centers. The data analysis reported demographics showing a majority of the sample of mature adults were female (98), Caucasian (134), over 66 (130), married (at least once) (122), and high school graduates (147). Factor analysis revealed a seven-factor solution accounting for 62.1% of the variance of FI, four of its seven factors consisting of three or more questions, and significant factor loadings for 22 of the 26 survey questions analyzed. Internal consistency reliability was measured using Cronbach's alpha; based on the five inter-item subscales (ADLS, PS, CS, ES, SS) analyzed, it was found that the overall alpha for Functional Independence (FI) was .7771. In contrast, based on the 26 questions analyzed, it was found that the overall alpha for Functional Independence (FI) was .8285. Null hypotheses testing showed that significant correlations existed among each pair of quality of life variables analyzed; this was consistent with the research reviewed.

**The Two Selves** Oct 17 2022 Our experience of a unified sense of the self is underwritten by a multiplicity of self-aspects having very different metaphysical commitments. Our experience of unity is provided by a process-which, under certain clinical conditions, is rendered inoperative-that enables a person to experience mental states as personally owned.
