The book walks the reader through transgender issues, starting with "What does transgender mean?" before moving on to more complex topics including growing up trans, dating and sex, medical and mental health, and debates around gender and feminism. Brynn also challenges deliberately deceptive information about transgender people being put out into the public sphere. Transphobic myths are debunked and biased research, bad statistics and bad science are carefully and clearly refuted. This important and engaging book enables any reader to become informed the most critical public conversations around transgender people, and become a better ally as a result. Computational Statistical Mechanics describes the use of fast computers to simulate the equilibrium and nonequilibrium properties of gases, liquids, and solids at, and away from equilibrium. The underlying theory is developed from basic principles and illustrated by applying it to the simplest possible examples. Thermodynamics, based on the ideal gas thermometer, is related to Gibb's statistical mechanics through the use of Nosé-Hoover heat reservoirs. These reservoirs use integral feedback to control temperature. The same approach is carried through to the simulation and analysis of nonequilibrium mass, momentum, and energy flows. Such a unified approach makes possible consistent mechanical definitions of temperature, stress, and heat flux which lead to a microscopic demonstration of the Second Law of Thermodynamics directly from mechanics. The intimate connection linking Lyapunov-unstable microscopic motions to macroscopic dissipative flows through multifractal phase-space structures is illustrated with many examples from the recent literature. The book is well-suited for undergraduate courses in advanced thermodynamics, statistical mechanic and transport theory, and graduate courses in physics and chemistry. can be no foundation for history without biography. History is a generalization of particulars. It presents wide extended views. To use a paradox, history gives us but a part of history. The #1 international bestseller from the author of The Book of Awesome that "reveals how all of us can live happier lives" (Gretchen Rubin). What is the formula for a happy life? Neil Pasricha is a Harvard MBA, a New York Times–bestselling author, a Walmart executive, a father, a husband. After selling more than a million copies of the Book of Awesome series, wherein he observed the everyday things he thought were awesome, he now shifts his focus to the practicalities of living an awesome life. In his new book The Happiness Equation, Pasricha illustrates how to want nothing and do anything in order to have everything. If that sounds like a contradiction in terms, you simply have yet to unlock the 9 Secrets to Happiness. Each secret takes a piece out of the core of common sense, turns it on its head to present it in a completely new light, and then provides practical and specific guidelines for how to apply this new outlook to lead a fulfilling life. Once you've unlocked Pasricha's 9 Secrets, you will understand counter intuitive concepts such as: Success Does Not Lead to Happiness, Never Take Advice, and Retirement Is a Broken Theory. You will learn and then master three brand-new fundamental life tests: the Saturday Morning Test, The Bench Test, and the Five People Test. You will know the difference between external goals and internal goals and how to make more money than a Harvard MBA (hint: it has nothing to do with your annual salary). You will discover that true wealth has nothing to do with money, multitasking is a myth, and the elimination of options leads to more choice.
